AUGUST
2027
SECOND HALF | PREVENTION

TOOLS AND LOADS
SAFE TRANSPORT

Before departure, make sure the load cannot shift.

1. Hazards and risks

Hazards: Loose tools, poor load distribution and inadequate securing.

Risks: Flying objects, lost load, loss of control or injuries.

2. Before you start

- Check mass, dimensions and vehicle capacity.
- Check lashing points and securing devices.
- Separate loads from occupants appropriately.

3. Stop and report

- Loose or poorly supported load, or obstructed visibility.
- Damaged strap or unsuitable securing point.
- Load has shifted: stop somewhere safe.

4. What to do: four prevention steps

1

Plan

Check vehicle and load to be carried.

2

Arrange

Distribute and support the load properly.

3

Secure

Use suitable devices and points.

4

Check

Confirm safety before departure.

5. Choose the right preventive measure

Situation	Preventive measure
Tools	Store in secured boxes or compartments.
Reels / parts	Prevent rolling and shifting during the journey.
Straps / lashings	Check capacity, condition and correct use.
Unloading	Open and release without entering the fall zone.

Good practice: Do not use ropes or straps without confirmed suitability. Securing depends on load, vehicle and device instructions; there is no universal solution.

6. FORTNIGHTLY ACTION Before the next journey, check how a toolbox or reel is prevented from moving.
