SECOND HALF | PREVENTION

# MOBILE ELEVATING WORK PLATFORMS

**Choose the equipment and check the site before elevating.**

## 1. Hazards and risks

**Hazards:** Unstable ground, obstacles and nearby power lines.

**Risks:** Overturning, falls, collisions or entrapment in the platform.

## 2. Before you start

- Confirm training and familiarisation with the model.
- Check equipment, ground and work area.
- Agree emergency and lowering arrangements with ground support.

## 3. Stop and report

- Defective control, guard or device.
- Wind, ground or obstacles compromise safety.
- Missing emergency plan or support arrangements.

## 4. What to do: four prevention steps

1 

**Select**

Suitability for the site and task.

2 

**Check**

Follow manufacturer checks.

3 

**Isolate**

Control people and obstacles.

4 

**Prepare**

Confirm support and emergency lowering.

## 5. Choose the right preventive measure

| Situation | Preventive measure |
|---|---|
| **Ground / supports** | Check bearing capacity, level and supports against the manual. |
| **Capacity / wind** | Respect model limits and total load. |
| **Personal protection** | Use the system required for the model and risk assessment. |
| **Platform / surroundings** | Do not climb guardrails; control obstacles and services. |

**Good practice:** Do not use without training and confirmed safe conditions. Do not improvise anchors or transfer people to another structure without a specifically planned solution.

**6. FORTNIGHTLY ACTION** Before use, check the model manual, work area and who can operate emergency controls.

**SELECT • CHECK • ISOLATE • PREPARE**
