WORKPLACE SAFETY CAMPAIGN

WORKING AT HEIGHT

Plan access. Prevent falls before starting.

1. Hazards and risks

Hazards: Edges, openings and unsafe supports or access.

Risks: People or objects falling, with serious or fatal injuries.

2. Before you start

- Assess whether the task can be done from ground level.
- Choose suitable access and protection.
- Confirm training, conditions and emergency response.

3. Stop and report

- Missing protection or unsafe access.
- Unstable supports or adverse weather.
- Missing equipment or adequate response plan.

4. Avoid exposure and confirm conditions

1

Plan

Reduce the need to climb.

2

Choose access

Use the method suited to the task.

3

Check

Confirm supports and protection.

4

Prepare response

Know the emergency plan.

5. Protection depends on task and location

Situation	Preventive measure
Ground-level reach	Consider means that avoid climbing.
Edge / opening	Prioritise suitable collective protection.
Personal protection	System, anchor and rescue must be defined.
Objects / people below	Prevent falling objects and control access.

Good practice: A harness alone does not guarantee protection. Work at height requires training, suitable equipment and emergency planning; do not improvise anchors.

6. MONTHLY ACTION Before a task at height, confirm access, protection and emergency response with the team. Report anything missing.

PLAN • PREVENT FALLS • DO NOT IMPROVISE

ACT: access equipment for work at height HSE: work at height
